| Project Name  | Project – Natural Disaster Intensity Analysis and Classification Using Artificial Intelligence |
| Maximum Marks | 4 Marks  |

### Solution Architecture:

Solution architecture is a complex process – with many sub-processes – that bridges the gap between business problems and technology solutions. Its goals are to:

- Find the best tech solution to solve existing business problems.
- Describe the structure, characteristics, behavior, and other aspects of the software to project stakeholders.
- Define features, development phases, and solution requirements.
- Provide specifications according to which the solution is defined, managed, and delivered.

### Example - Solution Architecture Diagram:

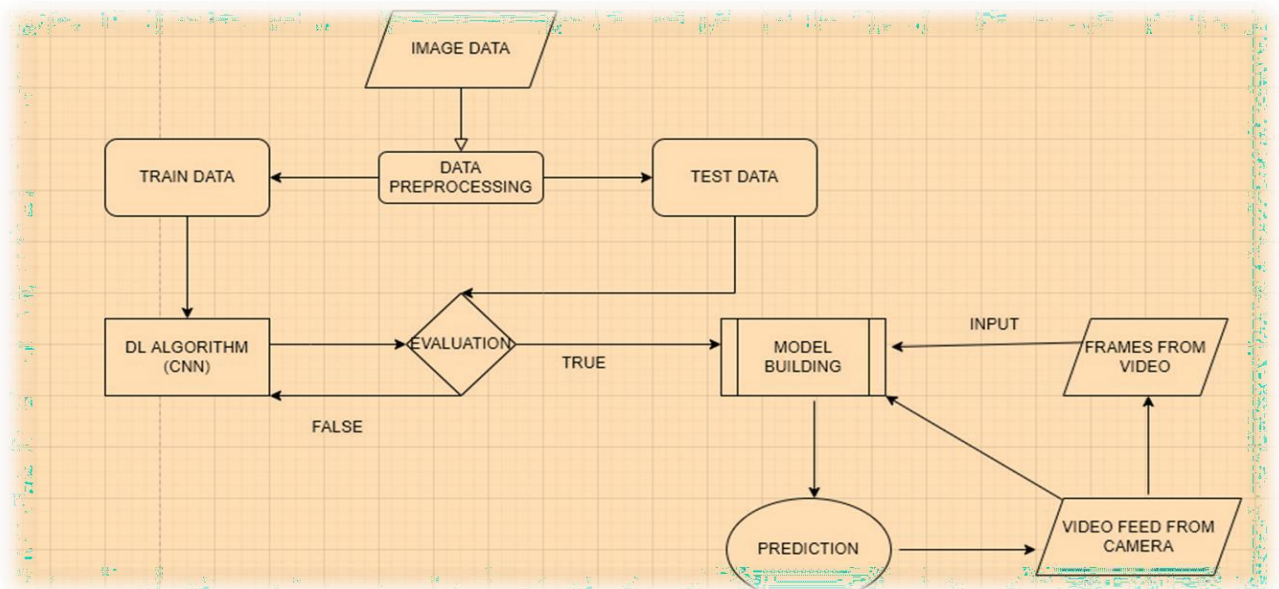

Fig 1. Architecture and Flow Diagram to classify the natural disaster using Deep Learning Algorithm.
